

Website Landing Page UI Design

Conversion-focused landing page — wireframe, high-fidelity mockup & design specs

Task	Landing Page UI Design
Product	Pace — Focus-time visibility tool for remote teams
Deliverables	Wireframe, hi-fi mockup, design rationale
Format	Coded prototype (HTML/CSS) + exported PNGs

1. Task Overview

Goal: Design a conversion-focused landing page for a product or service.

Since the brief allowed any product or service, I grounded the design in a concrete, specific product rather than generic SaaS filler — **Pace**, a focus-time visibility tool that lets remote teams see when a teammate is in a deep-work session, so people don't get interrupted mid-flow. This gave me a real problem to design around (interruptions, flow state, async respect) instead of placeholder copy.

- Wireframe
- High-fidelity desktop + mobile
- Hero · Features · Testimonials · CTA
- Color & type system
- Component specs

Tools used

The high-fidelity mockup was first built as real, responsive HTML/CSS — this allowed it to be reviewed as a working prototype with live animation (the focus timer ring) and true responsive behavior. It was then deployed to Netlify for a public live preview, and imported into Figma using the *html.to.design* plugin (Auto Layout + image extraction enabled) to produce an editable, layered Figma file. Headline typography was manually corrected in Figma to Fraunces (Semi Bold) after import, since web font loading isn't always preserved by the conversion.

2. Links

-  **Figma Prototype (view access)**
<https://www.figma.com/design/FfqTzaiWLUCFaaEi5yAW3x/Untitled?node-id=48-473>
Editable Figma file — desktop frame, organized layers, Fraunces/Inter type system applied. Share access set to "Anyone with the link can view."
-  **Live Preview (Netlify)**
<https://pace-focus-timer.netlify.app/>
The working, responsive HTML/CSS build — lets reviewers see the real animated, responsive page (live timer, hover states) rather than only static images.

3. Wireframe (Low-Fidelity)

The wireframe establishes structure before visual design: nav → hero (headline, subhead, CTA pair, product demo) → social proof logos → 3-up feature grid → testimonials → final CTA → footer. Labelled regions mark each section's purpose.

Fig 1. Wireframe — navigation, hero, and structural placeholders (top portion shown; full file in repo)

4. High-Fidelity Mockup — Desktop

Hero Section

The hero's centerpiece is a live, animated timer widget showing an active focus session — the product demonstrates itself rather than describing itself. Risk-reducing microcopy ("No credit card required") sits directly under the CTA pair to lower signup friction.

NEW Shared focus sessions for teams

Deep work, made *visible*.

Pace shows your team when someone's heads-down
— so no one interrupts a flow state by accident.

Social Proof & Features

Logo strip provides immediate social proof below the fold. Each feature card pairs an icon, a benefit-led heading, and a one-line description.

TRUSTED BY FOCUSED TEAMS AT

Northwind Halcyon Fieldnote Loam Quiet Co.

WHY TEAMS SWITCH

Built for the work that needs quiet

Calendars block time. Pace protects it — and lets your team see that protection happening in real time.

Visible focus status

Your status updates everywhere your team works — Slack, calendar, and email — the moment you start a session.

Smart interruption rules

Set who can break through during a session and who gets queued for after — urgent pings still get through.

Team focus patterns

See when your team focuses best as a group, and protect those hours from meetings by default.

Testimonials & Footer

fewer mid-task pings

6,200+

teams on Pace

4.8/5

average rating

FROM THE PEOPLE USING IT

Teams notice the difference fast

★★★★★

We went from 40 Slack pings a day to maybe 10. People actually wait now because they can see I'm in a session.

Priya Nair
Engineering Lead, Halcyon

★★★★★

The weekly focus report changed how I schedule my own week. I didn't realize how fragmented my mornings were.

Marcus Webb
Product Designer, Loom

Fig 5. Final CTA and footer

5. High-Fidelity Mockup — Mobile

All grids collapse to a single column on mobile; CTA buttons go full-width; the demo widget switches from a horizontal layout to a stacked, centered layout. Type scales down from 64px to 36px on the H1 to avoid awkward wrapping.

Fig 6. Mobile hero — 390px viewport (iPhone-class)

Rendering note: these PNGs were captured with a sandboxed screenshot tool using an older WebKit engine — it doesn't support modern CSS Grid track sizing and couldn't reach Google Fonts over the network. As a result, the screenshots show system-font fallbacks and some grids (the 3-column "How it works" steps, the 4-column stats band) collapsed to single-column in these images only. **The actual landing-page.html file uses standard, widely-supported CSS** and renders correctly — full multi-column layout, custom typefaces (Fraunces / Inter / JetBrains Mono) — in any modern browser, including via GitHub Pages. Open the live file or the repo's HTML directly to review the design as intended.

6. Design Specifications

Color Palette

	Token	Hex	Usage
	Background	#0E0E10	Page background
	Surface	#1C1C1F	Cards, demo widget, dividers
	Ink (text)	#FAFAF7	Primary text on dark
	Ink Dim	#9A9AA0	Secondary text
	Ink Faint	#6B6B70	Captions / tertiary text
	Accent	#FF5A36	CTAs, links, the one signal color
	Border	#2C2C30	Hairline dividers, card borders

Dark background with a single warm orange accent was chosen deliberately over the expected blue SaaS palette — blue reads as generic enterprise software, while orange/red signals urgency and energy, matching a product about protecting focused time.

Typography

Role	Typeface	Notes
Display (H1–H3)	Fraunces	Warm serif with optical sizing; headlines only, used with restraint

Body / UI	Inter	Paragraphs, navigation, buttons
Data / numbers	JetBrains Mono	Timer countdown and stat figures — reinforces the product's time-tracking nature

Component Specs

Component	Spec
Primary button	13-16px padding, 9px border-radius, #FF5A36 fill, #0E0E10 text, hover lift + glow shadow
Ghost button	Transparent fill, 1px #2C2C30 border, hover border darkens to #6B6B70
Card	#1C1C1F surface, 1px #2C2C30 border, 14px border-radius, hover lifts 3px with border highlight
Nav	Sticky, blurred glass background (backdrop-filter), 1px bottom border
Section spacing	110px vertical padding desktop / 70px mobile

Layout Structure

1. **Nav** — logo, 4 links, sign-in, primary CTA (collapses to logo + CTA on mobile)
2. **Hero** — eyebrow badge → H1 → subhead → CTA pair → microcopy → live demo widget
3. **Social proof strip** — 5 muted wordmarks
4. **Features** — 3-up icon/heading/description cards
5. **How it works** — 3 numbered steps (numbering justified: this is a literal sequence)
6. **Stats band** — 4 monospace metrics as proof reinforcement
7. **Testimonials** — 3-up star rating + quote + attribution
8. **Final CTA** — mirrored CTA pair with its own accent glow
9. **Footer** — brand recap + 3 link columns + legal row

Figma File — Final State

Screenshot of the editable Figma frame after import and typography correction. All sections, components, and the Fraunces/Inter type pairing are reflected in the layered file.

Fig 7. Figma frame — imported via *html.to.design*, headline typography corrected to Fraunces

7. Workflow — From Code to Figma

Steps actually used to produce the final Figma deliverable from the coded prototype:

1. Built the responsive landing page as a single HTML/CSS file (landing-page.html)
2. Deployed it as a static site via **Netlify Drop** → live URL: pace-focus-timer.netlify.app
3. In Figma, installed the **html.to.design** Community plugin
4. Ran the plugin against the live Netlify URL with **Auto Layout** and **Extract images to section** enabled, producing a fully layered, editable frame
5. Manually corrected headline typography post-import: selected all H1–H3 layers and reassigned the font from the substituted Inter to **Fraunces, Semi Bold**, matching the intended type system
6. Set Figma file sharing to **"Anyone with the link" → Viewer** and copied the share link into Section 2 of this document

This combined approach gets the best of both deliverables: a real, animated, responsive working prototype (Netlify) plus a clean, annotatable, editable design file (Figma) — without manually re-drawing every component from scratch.

8. Submission Checklist

- ☐ Build responsive HTML/CSS prototype
- ☐ Deploy to Netlify and verify live preview works
- ☐ Import into Figma via html.to.design (Auto Layout + image extraction)
- ☐ Fix headline typography (Fraunces) in Figma after import
- ☐ Set Figma sharing to "Anyone with the link" → Viewer
- ☐ Upload this PDF to Google Drive and set sharing to "Anyone with the link"
- ☐ Go to the Internspark Task Submission page
- ☐ Paste the Drive link, Figma link, and Netlify link — clearly labelled with the task number
